## APPLICATION INFORMATION

### Input Decoupling

A 1.0 μF ceramic capacitor is the recommended value to be connected between $V_{in}$ and GND. For PCB layout considerations, the traces of $V_{in}$ and GND should be sufficiently wide in order to minimize noise and prevent unstable operation.

### Output Decoupling

It is recommended to use a 0.1 μF ceramic capacitor on the $V_{out}$ pin. For better performance, select a capacitor with low Equivalent Series Resistance (ESR). For PCB layout considerations, place the output capacitor close to the output pin and keep the leads short as possible.
