

<b>Title</b>	<b><i>Reference Design Report for a 15 W Wide Range Input, Dual Output, Non-Isolated Flyback Converter Using InnoSwitch™ 3-EP INN3673C-H601</i></b>
<b>Specification</b>	85 VAC – 277 VAC Input; 5 V / 1.2 A and 12 V / 0.75 A Outputs
<b>Application</b>	Embedded Power Supply
<b>Author</b>	Applications Engineering Department
<b>Document Number</b>	RDR-752
<b>Date</b>	November 17, 2021
<b>Revision</b>	1.2

### **Summary and Features**

- High standby mode efficiency design to deliver up to 49 mA from 5 V with 0.3 W input power at 230 VAC
- Less than 50 mW no-load consumption across input range
- Using highly integrated solution with 725 V rated power MOSFET
- >83% average efficiency at 115 VAC and 230 VAC
- >6 dB conducted EMI margin
- Over-temperature protection with hysteretic recovery
- Auto-restart output short-circuit and open-loop protection

### **PATENT INFORMATION**

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at [www.power.com](http://www.power.com). Power Integrations grants its customers a license under certain patent rights as set forth at <https://www.power.com/company/intellectual-property-licensing/>.

**Important Note:**

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

## 1 Introduction

This document is an engineering report describing a non-isolated flyback converter designed to provide dual output of 5 V at 1.2 A and 12 V at 0.75 A from a wide input range of 85 VAC to 277 VAC. This power supply utilizes the INN3673C-H601 from the InnoSwitch3-EP family of devices.

This document contains the power supply specification, schematic, bill of materials, transformer documentation, printed circuit layout, and performance data.

Figure 1 – Populated Circuit Board Photograph, Top.

Figure 2 – Populated Circuit Board Photograph, Bottom.

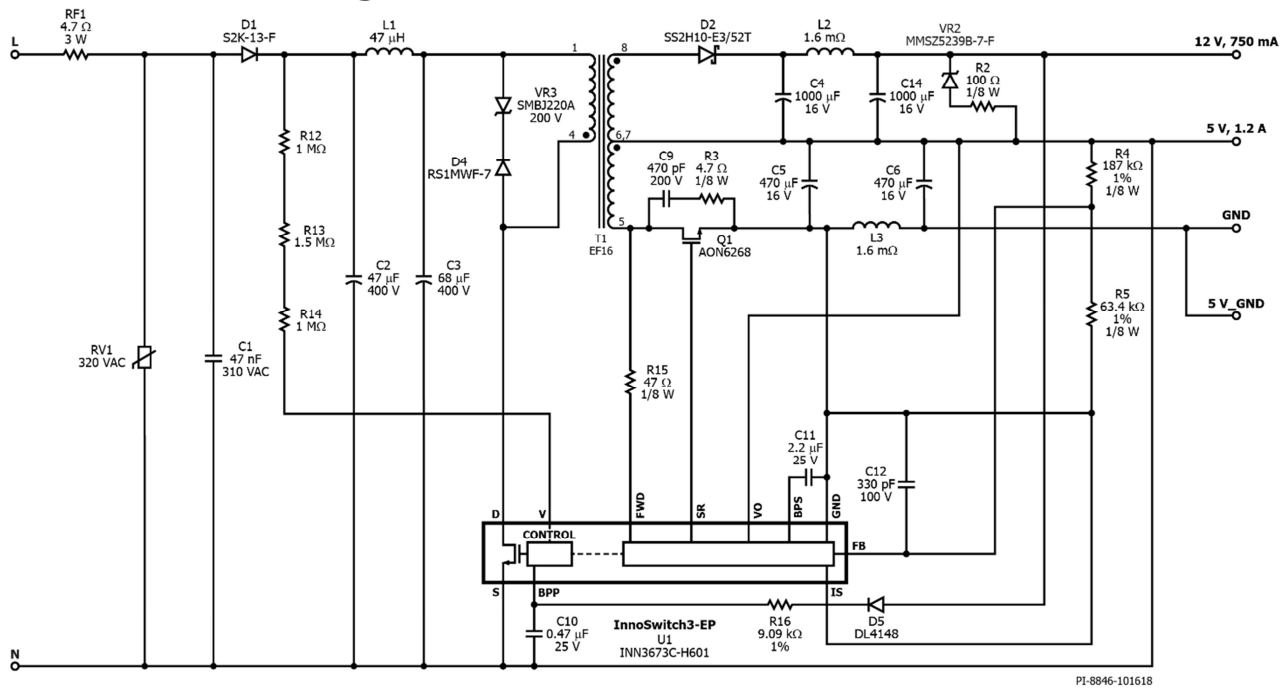

## 2 Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
<b>Input</b>						
Voltage	$V_{IN}$	85	115/230	277	VAC	2 Wire – no P.E.
Frequency	$f_{LINE}$	47	50/60	63	Hz	
No-load Input Power				45	mW	230 VAC Input.
<b>Output</b>						
Output Voltage 1	$V_{OUT1}$		5		V	±5% PCB Connector Side.
Output Current 1	$I_{OUT1}$		1.2		A	
Output Ripple Voltage 1	$V_{RIPPLE1}$			150	mVpp	Measured at the PCB Connector.
Output Voltage 2	$V_{OUT2}$		12		V	±10% PCB Connector Side.
Output Current 2	$I_{OUT2}$	0.02	0.75		A	
Output Ripple Voltage 2	$V_{RIPPLE2}$			200	mVpp	Measured at the PCB Connector.
Continuous Output Power	$P_{OUT}$			15	W	
<b>Efficiency</b>						
Average 25%, 50%, 75%, and 100%	$\eta_{AVE[BRD]}$	80			%	115 and 230 VAC Input.
<b>Environmental</b>						
Conducted EMI		CISPR22B / EN55022B Load floating				Resistive Load, 6 dB Margin.
Safety		IEC950 / UL1950 Class II				Designed to Meet.
Differential Line Surge		1			kV	230 VAC Input.
Ambient Temperature	$T_{AMB}$	0		40	°C	Free Convection, Sea Level in Sealed Enclosure.

### 3 Schematic Diagram

---

## 4 Circuit Description

The InnoSwitch3-EP family of devices integrates a 725 V rated power MOSFET switch along with both primary-side and secondary-side controllers in a single device. The INN3673C-H601 IC is used in the design of the 15 W non-isolated flyback with dual output of 5 V and 12 V delivering 1.2 A and 0.75 A, respectively.

### 4.1 *Input Filter and Rectifier*

Resistor RF1 is fusible, flameproof, wire-wound type and functions as a fuse and inrush current limiter which provide protection against catastrophic failure of components of the primary-side and limits the inrush current when the power supply is connected to the AC input supply due to low impedance of the input capacitors, C2 and C3, during start-up operation.

Varistor RV1 clamps the AC input voltage across the power supply against surge and voltage transients.

Input X capacitor C1 and pi filter combination of C2, L1, and C3 attenuate differential mode EMI.

Diode D1 rectifies the AC line voltage to half wave rectified DC and filtered by the input bulk storage capacitors C2 and C3.

### 4.2 *InnoSwitch3-EP Primary-Side*

The rectified and filtered input voltage is applied to one end of the primary winding of flyback transformer T1. The other side of T1 primary winding is driven by the integrated power MOSFET of IC U1 via the DRAIN (D) pin.

A Zener clamp composed of VR3 and D4 is connected across the primary winding of transformer T1. The primary clamp limits the peak drain voltage of the internal power MOSFET switch of U1 due to the effects of the transformer leakage reactance.

The IC is self-starting, using an internal high-voltage current source to charge the BPP pin capacitor, C10, when AC is first applied. However, connecting an external current source to the BPP pin significantly decreases no-load input power and improves overall efficiency. This external current source for the BPP pin is tapped from the 12 V output controlled by resistor R16 via diode D5.

Resistors R12, R13, and R14 provide line voltage sensing and provide a current to the V pin of U1 which is proportional to the DC voltage across C3. At approximately 100 VDC, the current through these resistors exceeds the line undervoltage threshold, which results in enabling of U1. At approximately 410 VDC, the current through these resistors exceeds the line overvoltage threshold, which results in disabling of U1.

### 4.3 ***InnoSwitch3-EP Secondary-Side***

The secondary-side of the InnoSwitch3-EP provides output voltage, output current sensing and drive to a MOSFET providing synchronous rectification.

Transformer T1 has two secondary windings in an AC-stacked configuration for the dual output of 5 V and 12 V. Each secondary switching voltage is rectified by a synchronous rectifier Q1 and Schottky diode D3 for the 5 V and 12 V output, respectively. The secondary rectified voltages are filtered by low ESR type capacitors, C4 and C5. A post-filter using L2 and C6 for the 5 V output and L3 and C14 for the 12 V output are added to further improve peak-to-peak voltage ripple at the output connector. The RC snubber network, R3 and C9, limits the high frequency ringing across the SR FET Q1.

The gate of Q1 is turned on based on the winding voltage sensed via R15 and the FWD pin of the IC. In continuous conduction mode operation, the power MOSFET is turned off just prior to the secondary-side controller commanding a new switching cycle from the primary. In discontinuous mode the MOSFET is turned off when the voltage drop across the MOSFET falls below a threshold ( $V_{SR(TH)}$ ). Secondary-side control of the primary-side MOSFET ensures that it is never turned on simultaneously with the synchronous rectification MOSFET. The MOSFET drive signal is the output of the SR pin.

The secondary-side of the IC is self-powered from either the secondary winding forward voltage or the output voltage. The output voltage powers the device, feeds into the VO pin, and charges the decoupling capacitor C11 via an internal regulator. The power supply enters auto-restart when the sensed output voltage is lower than 3 V.

IC U1 has an internal voltage and current feedback control circuitry. The 5 V output is sensed through the resistor dividers R4 and R5 to keep the output regulation within limits by maintaining 1.265 V across the FB pin. In addition, the decoupling capacitor C12 provides better transient response during output load changes.

The 12 V output is quasi-regulated with the tight coupling between 5 V and 12 V secondary windings. A simple circuit using Zener diode VR2 and resistor R2 clamps the 12 V output up to ~14 V when then the 5 V output is fully loaded.

### 4.4 ***Design Key Points***

The design targets to improve the standby mode efficiency by maximizing the available output power in a given input power required. Standby mode efficiency was optimized with the transformer design and selection of active devices, primary clamp, filter components and bias resistors values.

#### 4.4.1 *Transformer Design*

- Z-winding technique on the primary-side of transformer resulting to low interwinding capacitance and a direct influence on the  $CV^2f$  loss

- 
- Lower reflected output voltage (VOR) setting yields to lower secondary peak, rms, and average currents which affects the losses of the output rectifiers
  - Proper selection of core material

#### 4.4.2 *Primary Clamp*

- Proper tuning of primary clamp required to meet derated primary MOSFET VDS at maximum input voltage and sufficient margin on EMI performance

#### 4.4.3 *Primary Bias*

- Since the bias voltage for the BPP pin is tapped from the 12 V output, BPP pin bias current appears as a preload to the 12 V rail
- Optimize BPP bias current within 230  $\mu$ A to 250  $\mu$ A during standby mode

#### 4.4.4 *Secondary Rectification*

- Using MOSFET for synchronous rectification significantly decreases loss due to lower equivalent  $I^2R_{DS(ON)}$
- Otherwise for other output voltage settings, use Schottky rectifiers due to its lower forward voltage and faster reverse recovery time specification compared to fast recovery type of diode.
- Selecting higher current rating of synchronous rectifiers / Schottky diodes of at least three times the actual DC current through the output rectifiers results to lower bulk resistance and, in turn, allowing the device to operate at lower current density. Bigger packages also contribute to better thermal management because of lower thermal resistance

#### 4.4.5 *Filter Components*

- Lower ESR causes capacitor to dissipate less power when subjected to secondary ripple current
- Lower DC resistance directly decreases the dissipation across the ferrite bead

## 5 PCB Layout

PCB copper thickness is 2 oz. (2.8 mils / 70  $\mu\text{m}$ ) unless otherwise stated.

Figure 4 – Printed Circuit Layout, Top.

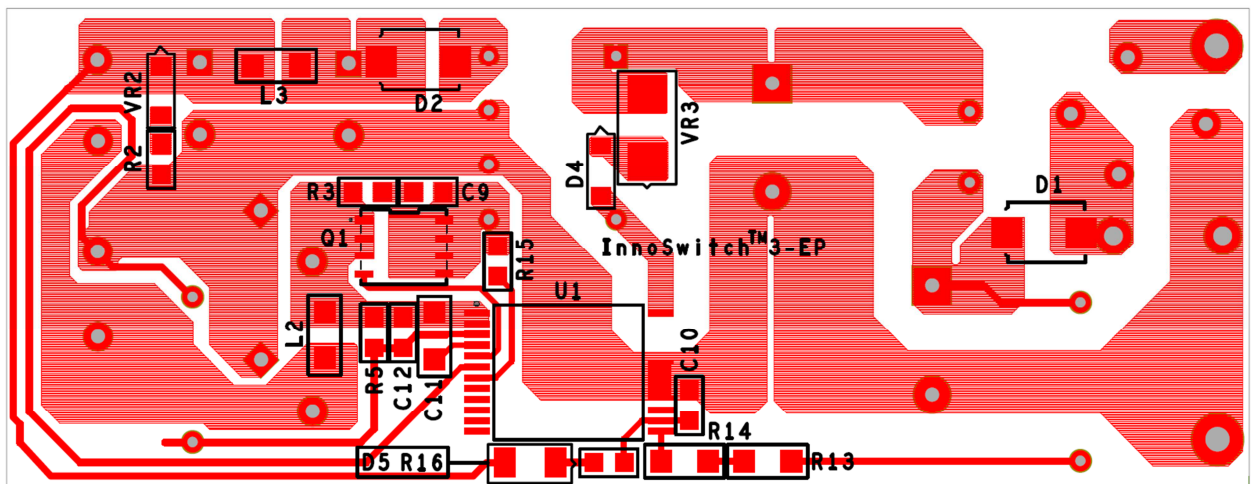

Figure 5 – Printed Circuit Layout, Bottom.

## 7 Transformer Specification

### 7.1 Electrical Diagram

Figure 6 – Transformer Electrical Diagram.

### 7.2 Electrical Specification

<b>Electrical Strength</b>	1 sec, 60 Hz, from pins 5-8 to pins 1,4	3000 VAC
<b>Primary Inductance</b>	Pins 1-4, all other windings open, measured at 100 kHz, $1 V_{RMS}$ .	2017 $\mu$ H $\pm$ 5%
<b>Primary Leakage Inductance</b>	Pins 1-4, with pins 5-8 shorted, measured at 100 kHz, $0.4 V_{RMS}$ .	75 $\mu$ H (Max.)

### 7.3 Material List

Item	Description
[1]	Core: EF16, Ferrite Core N87 gapped for ALG of 72nH/T <sup>2</sup> . Part Number: B66307G0000X187 EPCOS TDK.
[2]	Bobbin: EF16 Vertical.
[3]	Magnet Wire: #33 AWG, Double Coated.
[4]	Magnet Wire: #25 AWG, Double Coated.
[5]	Magnet Wire: #23 AWG, Double Coated.
[6]	Tape: 3M 1298 Polyester Film, 1 mil Thick, 10 mm Wide.
[7]	Tape: 3M 1298 Polyester Film, 1 mil Thick, 4.5 mm Wide.
[8]	Varnish: Dolph BC-359.

### 7.4 Transformer Build Diagram

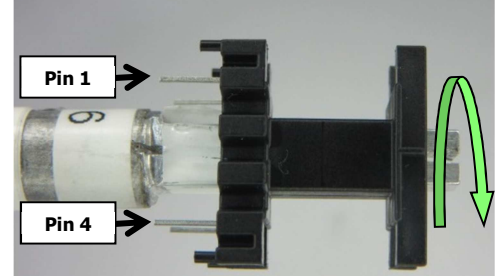

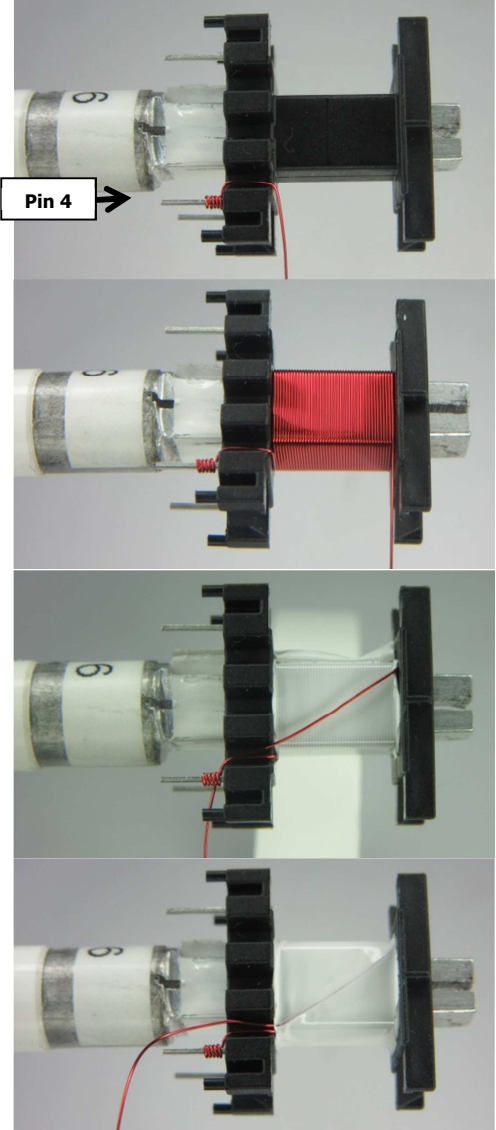

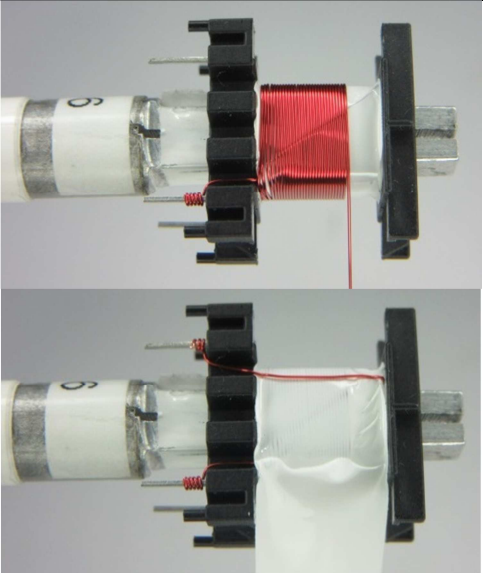

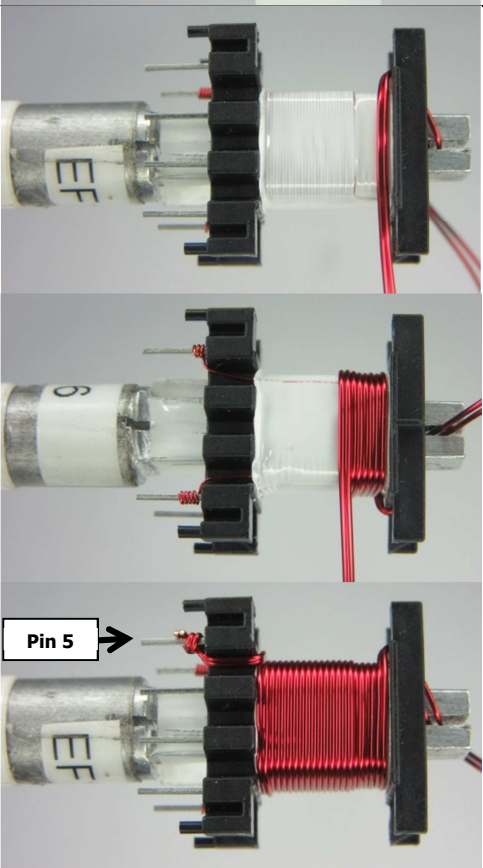

Figure 7 – Transformer Build Diagram.

### 7.5 Transformer Instructions

<b>Winding Preparation</b>	Remove unused pin 2 and pin 3. For the purpose of these instructions, bobbin is oriented on winder such that primary-side is on the left side with pin 4 at the bottom. Winding direction is clockwise direction.
<b>WD1 Primary</b>	Start at pin 4, wind 177 turns (x1 filar) of wire Item [3] in 4 layers using Z-winding configuration with tight tension (Layer 1 – 46T, Layer 2 – 45T, Layer 3 – 44T, Layer 4 – 42T).
<b>Insulation</b>	At the end of <i>each</i> layer, add 1 layer of tape Item [6]. Bring the wire back to the left. And add another one-half layer of tape Item [6]. Terminate at pin 1 after the fourth layer of winding.
<b>WD2 5 V</b>	Start winding at the right side of the bobbin with 9 turns (x2 filar) of wire Item [4]. Terminate winding at pin 5.
<b>Insulation</b>	Add 1 layer of tape Item [6] for insulation. Terminate the floating start of WD2 to pin 6 and add another 1 layer of tape Item [6].
<b>WD3 12 V</b>	Start winding at the right side of the bobbin with 12 turns (x1 filar) of wire Item [5]. Terminate winding at pin 7.
<b>Insulation</b>	Add 1 layer of tape Item [6] for insulation. Terminate the floating start of WD3 to pin 8 and add another 1 layer of tape Item [6].
<b>Finish</b>	Gap core halves for 2017 $\mu$ H inductance. Wrap core halves with tape Item [7]. Coat with varnish Item [8].

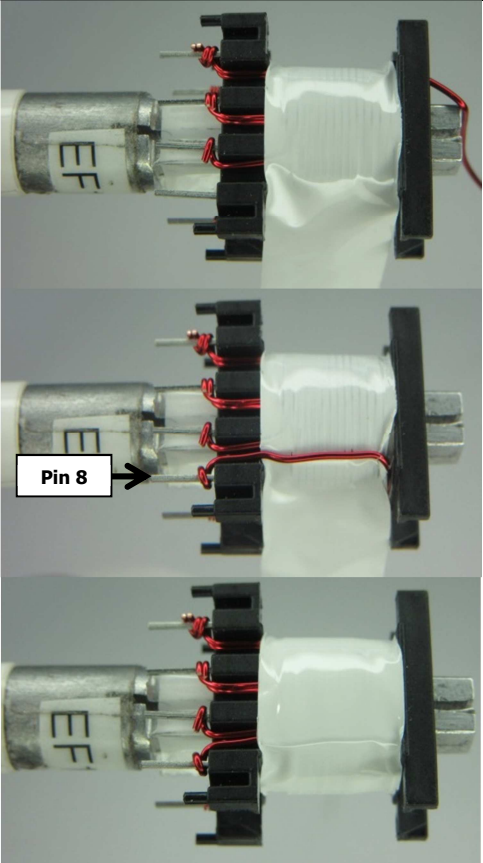

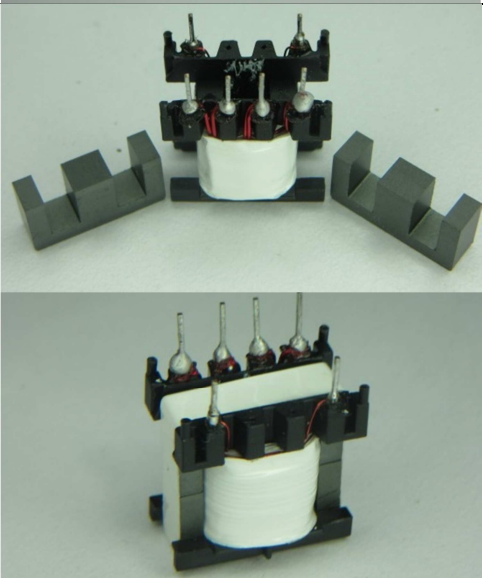

7.6 **Winding Illustrations**

<p><b>Winding Preparation</b></p>	 <p>The illustration shows a bobbin with four pins. Pin 1 is at the top left, Pin 4 is at the bottom left, Pin 2 is at the top right, and Pin 3 is at the bottom right. A green arrow indicates a clockwise winding direction starting from Pin 4.</p>	<p>Remove unused pin 2 and pin 3. For the purpose of these instructions, bobbin is oriented on winder such that primary-side is on the left side with pin 4 at the bottom. Winding direction is clockwise direction.</p>
<p><b>WD1 Primary and Insulation</b></p>	 <p>The illustration consists of four sequential photographs showing the winding process. The first photo shows the start at Pin 4 with a red wire. The second photo shows the first layer of red wire being wound. The third photo shows the wire being brought back to Pin 4 after a layer is completed. The fourth photo shows the wire being brought back to Pin 4 after a layer of tape is added.</p>	<p>Start at pin 4, wind 177 turns (x1 filar) of wire Item [3] in 4 layers using Z-winding configuration with tight tension</p> <p>Layer 1 – 46T, Layer 2 – 45T, Layer 3 – 44T, Layer 4 – 42T.</p> <p>At the end of each layer, add 1 layer of tape Item [6]. Bring the wire back to the left.</p> <p>Add another one-half layer of tape Item [6].</p>

<p><b>WD1 Primary and Insulation</b></p>		<p>At the end of the 4<sup>th</sup> winding layer, add one turn of tape Item [6] and terminate wire at pin 1.</p> <p>Add another one-half layer of tape Item [6].</p>
<p><b>WD2 5 V</b></p>		<p>Start winding at the right side of the bobbin with 9 turns (x2 filar) of wire Item [4].</p> <p>Terminate winding at pin 5.</p>

<p><b>Insulation</b></p>		<p>Add 1 layer of tape Item [6] for insulation.</p> <p>Terminate the floating start of WD2 to pin 6.</p> <p>Add another 1 layer of tape Item [6].</p>

 Zoom: 30  $\mu$ s / div.  
 $12 V PIV_{MAX} = 49.486 V$ .

## 10.4 **Brown-in / Brown-out Test**

No abnormal overheating or voltage overshoot / undershoot was observed during and after 0.1 V / s brown-in and brown-out test.

**Figure 99 – Brown-in Test.**  
 0 to 85 VAC 0.1 V / s.  
 CH1: 5 V  $I_{OUT}$ , 200 mA / div., 100 s / div.  
 CH2: 5 V  $V_{OUT}$ , 2 V / div., 100 s / div.  
 CH3: 12 V  $V_{OUT}$ , 4 V / div., 100 s / div.  
 CH4: AC  $V_{IN}$ , 40 V / div., 100 s / div.  
 Highest Average Input Power: 17.24 W  
 at 75.188 VAC.

**Figure 100 – Brown-out Test.**  
 85 to 0 VAC 0.1 V / s.  
 CH1: 5 V  $I_{OUT}$ , 200 mA / div., 100 s / div.  
 CH2: 5 V  $V_{OUT}$ , 2 V / div., 100 s / div.  
 CH3: 12 V  $V_{OUT}$ , 4 V / div., 100 s / div.  
 CH4: AC  $V_{IN}$ , 40 V / div., 100 s / div.  
 Highest Average Input Power: 17.84 W  
 at 63.43 VAC.

## 10.5 Fault Conditions

### 10.5.1 Output Short-Circuit

Test Condition: 5 V and 12 V output are shorted at the end of the cable.

**Figure 101** – 85 VAC, Short-Circuit during Normal Running Operation.

CH1: U1 V<sub>DS</sub>, 100 V / div., 1 s / div.

CH2: 5 V<sub>OUT</sub>, 2 V / div., 1 s / div.

CH3: 12 V<sub>OUT</sub>, 4 V / div., 1 s / div.

t<sub>AR(ON)</sub>: 60 ms.

t<sub>AR(OFF)</sub>: 1.53 s.

**Figure 102** – 277 VAC, Short-Circuit during Normal Running Operation.

CH1: U1 V<sub>DS</sub>, 100 V / div., 1 s / div.

CH2: 5 V<sub>OUT</sub>, 2 V / div., 1 s / div.

CH3: 12 V<sub>OUT</sub>, 4 V / div., 1 s / div.

t<sub>AR(ON)</sub>: 90 ms.

t<sub>AR(OFF)</sub>: 1.53 s.

**Figure 103** – 85 VAC, Short-Circuit during Start-up.

CH1: U1 V<sub>DS</sub>, 100 V / div., 1 s / div.

CH2: 5 V<sub>OUT</sub>, 2 V / div., 1 s / div.

CH3: 12 V<sub>OUT</sub>, 4 V / div., 1 s / div.

t<sub>AR(ON)</sub>: 50 ms.

t<sub>AR(OFF)</sub>: 1.55 s.

**Figure 104** – 277 VAC, Short-Circuit during Start-up.

CH1: U1 V<sub>DS</sub>, 100 V / div., 1 s / div.

CH3: 12 V<sub>OUT</sub>, 4 V / div., 1 s / div.

t<sub>AR(ON)</sub>: 60 ms.

t<sub>AR(OFF)</sub>: 1.54 s.

### 10.5.2 Line Overvoltage

Test Condition: Line Overvoltage Protection set to 290 VAC

**Figure 105** – Line Overvoltage during Normal Running Operation from 85 VAC.  
 CH1: U1  $V_{DS}$ , 100 V / div., 1 s / div.  
 CH2: 5  $V_{OUT}$ , 2 V / div., 1 s / div.  
 CH3: 12  $V_{OUT}$ , 4 V / div., 1 s / div.  
 CH4:  $AC_{IN}$ , 200 V / div., 1 s / div.

**Figure 106** – Line Overvoltage during Normal Running Operation from 277 VAC.  
 CH1: U1  $V_{DS}$ , 100 V / div., 1 s / div.  
 CH2: 5  $V_{OUT}$ , 2 V / div., 1 s / div.  
 CH3: 12  $V_{OUT}$ , 4 V / div., 1 s / div.  
 CH4:  $AC_{IN}$ , 200 V / div., 1 s / div.

**Figure 107** – Lined Overvoltage during Start-up.  
 CH1: U1  $V_{DS}$ , 100 V / div., 1 s / div.  
 CH2: 5  $V_{OUT}$ , 2 V / div., 1 s / div.  
 CH3: 12  $V_{OUT}$ , 4 V / div., 1 s / div.  
 CH4:  $AC_{IN}$ , 200 V / div., 1 s / div.

## 10.6 ***Output Ripple Measurements***

### 10.6.1 *Ripple Measurement Technique*

For DC output ripple measurements, a modified oscilloscope test probe must be utilized in order to reduce spurious signals due to pick-up. Details of the probe modification are provided in the Figures below.

The 4987BA probe adapter is affixed with two capacitors tied in parallel across the probe tip. The capacitors include one (1) 0.1  $\mu\text{F}/50\text{ V}$  ceramic type and one (1) 47  $\mu\text{F}/50\text{ V}$  aluminum electrolytic. The aluminum electrolytic type capacitor is polarized, so proper polarity across DC outputs must be maintained (see below).

**Figure 108** – Oscilloscope Probe Prepared for Ripple Measurement. (End Cap and Ground Lead Removed)

**Figure 109** – Oscilloscope Probe with Probe Master ([www.probemaster.com](http://www.probemaster.com)) 4987A BNC Adapter. (Modified with wires for ripple measurement, and two parallel decoupling capacitors added)

### 10.6.2 Measurement Results

Test Condition: Room Temperature, measured across the PCB connector

#### 10.6.2.1 100% Load Condition

**Figure 110** – 85 VAC 60 Hz, 100% Load.

## 11 Thermal Performance

### 11.1 *Room Temperature Thermal Scan*

Open frame unit was placed inside the enclosure to prevent airflow that may affect the thermal measurements. Temperature was measured using Thermal Camera. Soak time at full load is 2 hours.

**Figure 138** – Thermal Performance Set-up Using an Acrylic Box.

## 11.1.1 85 VAC

Component	Temperature (°C)
INN3673C IC (U1)	75.3
Input Rectifier (D1)	48.0
Input Capacitor (C2)	43.9
Input Choke Filter (L1)	45.4
Input Capacitor (C3)	50.0
Transformer (T1)	77.8
Zener Diode Clamp (VR3)	95.8
12 V Output Diode (D2)	76.2
5 V Output Synchronous Rectifier (Q1)	63.4
12 V Output Capacitor (C4)	60.4
12 V Output Capacitor (C14)	46.7
5 V Output Capacitor (C5)	46.5
5 V Output Capacitor (C6)	45.7
Ambient Temperature	25.1

## 11.1.2 115 VAC

Figure 141 – 115 VAC, Full Load. Top Side.

Figure 142 – 115 VAC, Full Load. Bottom Side.

Component	Temperature (°C)
INN3673C IC (U1)	68.1
Input Rectifier (D1)	45.0
Input Capacitor (C2)	43.4
Input Choke Filter (L1)	45.6
Input Capacitor (C3)	49.3
Transformer (T1)	69.8
Zener Diode Clamp (VR3)	87.7
12 V Output Diode (D2)	74.6
5 V Output Synchronous Rectifier (Q1)	60.6
12 V Output Capacitor (C4)	56.3
12 V Output Capacitor (C14)	49.3
5 V Output Capacitor (C5)	45.2
5 V Output Capacitor (C6)	48.5
Ambient Temperature	25.0

## 11.1.3 230 VAC

Figure 143 – 230 VAC, Full Load. Top Side.

Figure 144 – 230 VAC, Full Load. Bottom Side.

Component	Temperature (°C)
INN3673C IC (U1)	64.4
Input Rectifier (D1)	41.7
Input Capacitor (C2)	42.7
Input Choke Filter (L1)	43.6
Input Capacitor (C3)	47.8
Transformer (T1)	70.3
Zener Diode Clamp (VR3)	81.5
12 V Output Diode (D2)	73.1
5 V Output Synchronous Rectifier (Q1)	58.7
12 V Output Capacitor (C4)	57.1
12 V Output Capacitor (C14)	47.2
5 V Output Capacitor (C5)	48.3
5 V Output Capacitor (C6)	44.6
Ambient Temperature	25.3

## 11.1.4 277 VAC

Figure 145 – 277 VAC, Full Load. Top Side.

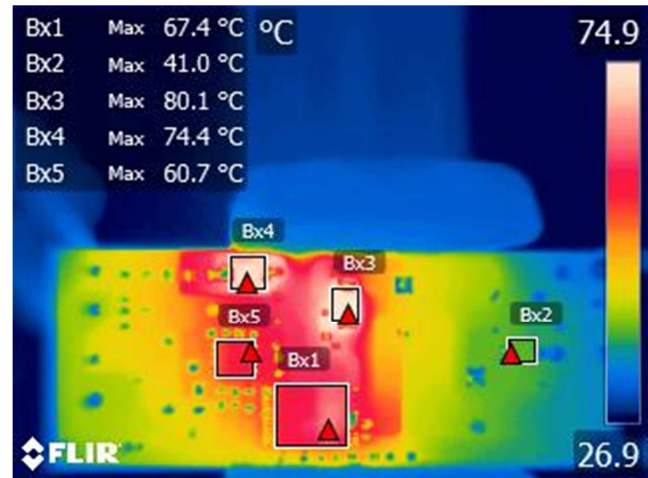

Figure 146 – 350 VAC, Full Load.

Component	Temperature (°C)
INN3673C IC (U1)	67.4
Input Rectifier (D1)	41.0
Input Capacitor (C2)	41.7
Input Choke Filter (L1)	42.8
Input Capacitor (C3)	47.9
Transformer (T1)	70.1
Zener Diode Clamp (VR3)	80.1
12 V Output Diode (D2)	74.4
5 V Output Synchronous Rectifier (Q1)	60.7
12 V Output Capacitor (C4)	54.5
12 V Output Capacitor (C14)	48.5
5 V Output Capacitor (C5)	53.0
5 V Output Capacitor (C6)	47.3
Ambient Temperature	25.4

### 11.2 **70 °C Ambient Thermal Performance**

Open frame unit was placed inside the enclosure to prevent airflow that may affect the thermal measurements. Ambient temperature inside enclosure is 70 °C. Temperature was measured using type T thermocouple. Soak time at full load is 1 hour.

**Figure 147** – Thermal Performance Set-up using Thermal Chamber.

## 11.2.1 85 VAC

Figure 148 – Thermal Performance at 70 °C (85 VAC).

Component	Temperature (°C)
INN3673C IC (U1)	113.0
Input Rectifier (D1)	101.7
Input Capacitor (C2)	85.6
Input Choke Filter (L1)	94.4
Input Capacitor (C3)	98.2
Transformer-Winding (T1-W)	115.9
Transformer-Core (T1-C)	109.1
Zener Diode Clamp (VR3)	121.3
12 V Output Diode (D2)	107.6
5 V Output Synchronous Rectifier (Q1)	98.2
12 V Output Capacitor (C4)	93.8
12 V Output Capacitor (C14)	86.4
5 V Output Capacitor (C5)	90.8
5 V Output Capacitor (C6)	83.7
Ambient Temperature	70.9

11.2.2 277 VAC

Figure 149 – Thermal Performance at 70 °C (277 VAC).

Component	Temperature (°C)
INN3673C IC (U1)	101.5
Input Rectifier (D1)	83.1
Input Capacitor (C2)	79.1
Input Choke Filter (L1)	85.2
Input Capacitor (C3)	86.8
Transformer-Winding (T1-W)	104.9
Transformer-Core (T1-C)	100.3
Zener Diode Clamp (VR3)	110.1
12 V Output Diode (D2)	102.2
5 V Output Synchronous Rectifier (Q1)	92.1
12 V Output Capacitor (C4)	88.9
12 V Output Capacitor (C14)	83.3
5 V Output Capacitor (C5)	95.6
5 V Output Capacitor (C6)	79.6
Ambient Temperature	71.0

### 11.3 Over-Temperature Protection

#### 11.3.1 85 VAC

Figure 150 – 85 VAC Over-Temperature Protection.

Component	Temperature (°C) At OTP Trigger	Temperature (°C) At Recovery
INN3673C IC (U1)	133.1	67.9
Input Rectifier (D1)	115.2	72.6
Input Capacitor (C2)	99.6	73.0
Input Choke Filter (L1)	106.0	74.4
Input Capacitor (C3)	108.8	73.0
Transformer-Winding (T1-W)	127.8	70.3
Transformer-Core (T1-C)	121.8	67.1
Zener Diode Clamp (VR3)	141.3	67.6
12 V Output Diode (D2)	125.0	65.9
5 V Output Synchronous Rectifier (Q1)	115.0	65.8
12 V Output Capacitor (C4)	108.5	66.0
12 V Output Capacitor (C14)	102.4	65.4
5 V Output Capacitor (C5)	106.5	66.3
5 V Output Capacitor (C6)	100.7	64.6
Ambient Temperature	97.0	50.5

## 11.3.2 277 VAC

Figure 151 – 277 VAC Over-Temperature Protection.

Component	Temperature (°C) At OTP Trigger	Temperature (°C) At Recovery
INN3673C IC (U1)	136.0	66.5
Input Rectifier (D1)	111.1	68.6
Input Capacitor (C2)	108.1	68.4
Input Choke Filter (L1)	114.7	71.4
Input Capacitor (C3)	115.6	69.5
Transformer-Winding (T1-W)	134.3	64.6
Transformer-Core (T1-C)	130.1	61.8
Zener Diode Clamp (VR3)	143.8	64.1
12 V Output Diode (D2)	133.1	59.3
5 V Output Synchronous Rectifier (Q1)	125.2	60.1
12 V Output Capacitor (C4)	120.4	59.3
12 V Output Capacitor (C14)	115.5	58.5
5 V Output Capacitor (C5)	118.6	59.1
5 V Output Capacitor (C6)	113.5	57.8
Ambient Temperature	112.2	48.9

## 12 Conducted EMI

### 12.1 Test Set-up

#### 12.1.1 Equipment and Load Used

1. Rohde and Schwarz ENV216 two line V-network.
2. Rohde and Schwarz ESRP EMI test receiver.
3. Hioki 3322 power hitester.
4. Chroma measurement test fixture.
5. Full Load with input voltage set at 230 VAC and 115 VAC.

Figure 152 – Conducted EMI Test Set-up.

## 12.2 15 W Resistive Load, Floating Output

### 12.2.1 115 VAC, Line

Date: 9.AUG.2018 13:48:10

**Figure 153** – Floating Ground EMI at 115 VAC, Line.

12.2.2 115 VAC, Neutral

Date: 9.AUG.2018 13:49:28

Figure 154 – Floating Ground EMI at 115 VAC, Neutral.

12.2.4 230 VAC, Neutral

Date: 9.AUG.2018 13:45:25

Figure 156 – Floating Ground EMI at 230 VAC, Neutral.

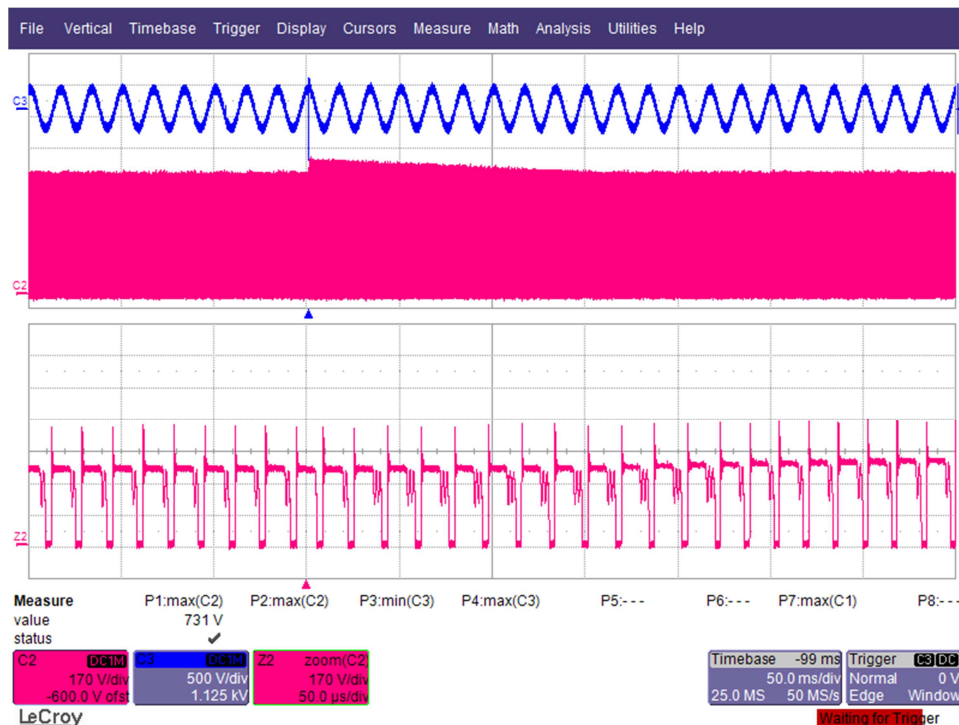

## 13 Line Surge

The unit was subjected to  $\pm 1000$  V differential surge test using 10 strikes at each condition. A test failure is defined as a non-recoverable interruption of output requiring repair or recycling of input voltage.

### 13.1 Differential Surge Test

Surge Voltage (kV)	Phase Angle (°)	IEC Coupling	Generator Impedance ( $\Omega$ )	Number Strikes	Result
+1	0	L1 / L2	2	10	PASS
-1	0	L1 / L2	2	10	PASS
+1	90	L1 / L2	2	10	PASS
-1	90	L1 / L2	2	10	PASS
+1	180	L1 / L2	2	10	PASS
-1	180	L1 / L2	2	10	PASS
+1	270	L1 / L2	2	10	PASS
-1	270	L1 / L2	2	10	PASS

**Note:** In all PASSED results, no damage and no auto-restart were observed.

**Figure 157** – Input AC Voltage vs. U1 MOSFET V<sub>DS</sub> during 1 kV Differential Surge.

---

## 14 Revision History

Date	Author	Revision	Description & Changes	Reviewed
31-Oct-18	CE	1.0	Initial Release.	Apps & Mktg
11-Jun-20	KM	1.1	Converted to RDR.	Apps & Mktg
17-Nov-21	KM	1.2	Added Magnetics Supplier. Updated Format	Apps & Mktg

Reference Designs are technical proposals concerning how to use Power Integrations' gate drivers in particular applications and/or with certain power modules. These proposals are "as is" and are not subject to any qualification process. The suitability, implementation and qualification are the sole responsibility of the end user. The statements, technical information and recommendations contained herein are believed to be accurate as of the date hereof. All parameters, numbers, values and other technical data included in the technical information were calculated and determined to our best knowledge in accordance with the relevant technical norms (if any). They may base on assumptions or operational conditions that do not necessarily apply in general. We exclude any representation or warranty, express or implied, in relation to the accuracy or completeness of the statements, technical information and recommendations contained herein. No responsibility is accepted for the accuracy or sufficiency of any of the statements, technical information, recommendations or opinions communicated and any liability for any direct, indirect or consequential loss or damage suffered by any person arising therefrom is expressly disclaimed.

Power Integrations reserves the right to make changes to its products at any time to improve reliability or manufacturability. Power Integrations does not assume any liability arising from the use of any device or circuit described herein. POWER INTEGRATIONS MAKES NO WARRANTY HEREIN AND SPECIFICALLY DISCLAIMS ALL WARRANTIES INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF THIRD PARTY RIGHTS.

**Patent Information**

The products and applications illustrated herein (including transformer construction and circuits' external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at [www.power.com](http://www.power.com). Power Integrations grants its customers a license under certain patent rights as set forth at <http://www.power.com/ip.htm>.
