

General Description

The MAX2248 evaluation kit (EV kit) simplifies evaluation of the MAX2248 power amplifier (PA). It enables testing of the device's RF performance and requires no additional support circuitry. The EV kit's signal inputs and outputs use SMA connectors to facilitate the connection of RF test equipment.

The MAX2248 EV kit is assembled with a MAX2248 and incorporates output-matching components optimized for 1880MHz to 1930MHz.

Features

- Easy Evaluation of the MAX2248
- +2.7V to +5V Single-Supply Operation
- RF Output Matched for Operation from 1880MHz to 1930MHz
- Jumpers for Digital Power Control and Shutdown
- All Critical Peripheral Components Included

Ordering Information appears at end of data sheet.

EV Kit Photo

Quick Start

The MAX2248 EV kit is fully assembled and factory tested. Follow the instructions in the Connections and Setup Section for proper device evaluation.

Required Equipment

This section lists the recommended test equipment to verify operation of the MAX2248. It is intended as a guide only, and some substitutions are possible:

- One RF signal generator capable of delivering at least +5dBm of output power at the operating frequency (HP 8648D, or equivalent)
- One RF power sensor capable of handling at least +20dBm of output power at the operating frequency (HP 8482A, or equivalent)
- One RF power meter capable of measuring up to +20dBm of output power at the operating frequency (HP 438A, or equivalent)
- An RF spectrum analyzer that covers the MAX2248 operating frequency range, as well as a few harmonics (HP 8562E, for example)
- A power supply capable of up to 0.25A at +2.7V to +5V
- An optional ammeter for measuring the supply current
- Two 50Ω SMA cables
- One SMA 20dB pad
- A network analyzer (HP 8753D, for example) to measure small-signal return loss and gain (optional)

Procedure

This section provides a step-by-step guide to operating the EV kit and testing the device’s function. Do not turn on the DC power or RF signal generators until all connections are made:

- 1) Connect a DC supply set to +3.2V (through an ammeter if desired) to the VCC and GND terminals on the EV kit. Do not turn on the supply.

- 2) Connect one RF signal generator to J1 (RFIN) SMA Connector on the EV Kit; do not turn on the generator’s output. Set the generator for an output frequency of 1900MHz at a power level of +3dBm.
- 3) Connect a 20dB pad to J2 (RFOUT) SMA Connector on the EV Kit. This is to prevent overloading of the power sensor and the power meter.
- 4) Connect a power sensor to the 20dB pad.
- 5) Connect the power sensor to a power meter. Set the power meter offset to 20dB and frequency to 1900MHz.
- 6) Connect jumpers J2, J3, and J4 to short D1, D0, and SHDN to VCC. This sets the MAX2248 to its highest power mode. The MAX2248 EV kit is shipped in this setting.
- 7) Turn on the DC supply.
- 8) Activate the RF generator’s output. The power meter should read approximately +20dBm. The supply current should increase to approximately 105mA.
- 9) Another method for determining gain is by using a network analyzer (optional). This has the advantage of displaying gain versus a swept-frequency band, in addition to displaying input return loss. Refer to the network analyzer manufacturer’s user manual for setup details.
- 10) The additional MAX2248 power modes are set by the jumper settings of J2 (D1) and J3 (D0). See [Table 1](#) belowin for these power level settings.

Layout Considerations

A good PC board is an essential part of an RF circuit design. The EV kit PC board can serve as a guide for laying out a board using the MAX2248. Keep traces carrying RF signals as short as possible to minimize radiation and insertion loss due to the PC board. Each VCC node on the PC board should have its own decoupling capacitor. This minimizes supply coupling from one section of the IC to another. A star topology for the supply layout, in which each VCC node on the circuit has a separate connection to a central VCC node, can further minimize coupling between sections of the IC. See the Layout section of the MAX2248 data sheet for more information.

Table 1. Control Inputs

DIGITAL CONTROL INPUTS			OUTPUT POWER AND SUPPLY CURRENT			
/SHDN	D1	D0	POWER LEVE	PIN (dBm)	POUT (dBm)	ICC (mA)
0	0	0	PA OFF	+3	-	<1μA
1	0	0	P1	+3	+4	73
1	0	1	P2	+3	+12	76
1	1	0	P3	+3	+18	82
1	1	1	P4	+3	+20	105
